

Doeling Development Feeding System

Shur-Gain 17% Kid Goat Developer Ration

Advice you can trust

There are a number of age-appropriate target weights you need to meet in order to get doelings into the milking line by one year of age. Replacement kids should be:

- 40% of their mature weight at Puberty (4-7 months)
- 60% of their mature weight at Breeding (7-9 months)
- 80% of their mature weight at Kidding (12-14 months)

The feeding and management of doelings during the 8 to 10 months of growth is an opportunity to promote rapid and adequate growth to help keep the doelings on target to kid out at about one year of age.

Achieving these growth targets means taking full advantage of the early pre-weaning growth and meeting the goal of having well-grown doelings in the milking line at one year old.

Specific formulation

SHUR-GAIN 17% Kid Goat Developer Ration provides a unique blend of protein and energy sources, minerals and vitamins for young growing doelings. This product is formulated to be both highly fortified and palatable to replacement doelings.

Feed the **SHUR-GAIN 17% Kid Developer Ration** post weaning at 200 to 500 grams / head / day depending on the quality of the forage and the desired rate of gain. Keep the ration fresh and free from any spoilage. Ensure doelings have access to clean, fresh water at all times.

Benefits

- Contains a variety of grain and carbohydrate sources to sustain live weight gains.
- Contains a variety of vegetable protein sources and an optimum level of bypass protein to support gains in growing doelings.
- Contains the optimum levels of macro minerals, trace minerals and vitamins to promote productivity, growth, health and skeletal development in replacement doelings.
- Feeding a pellet eliminates sorting - the doelings get all they need to help promote rapid growth.
