

Transition Doe Feeding System

SHUR-GAIN Capri Transition Dairy Goat Ration

Advice you can trust

The goals in feeding and managing transition does is to help achieve the ideal body condition 3 to 3.5 at kidding, to minimize metabolic disease and to prepare the doe for high milk production. In addition, the does need to produce strong viable kids and a plentiful supply of good quality colostrum.

Feeding and management during the last 3 to 6 weeks of gestation is critically important in the overall success of your dairy goat operation and has a significant impact on milk production and profitability.

SHUR-GAIN Capri Transition Dairy Goat Ration is an innovative feeding system developed for close-up does that is fed free choice along with hay.

Specific formulation

The **SHUR-GAIN Capri Transition Dairy Goat Ration** is highly fortified, yet palatable. It provides optimum levels of protein, energy, minerals and vitamins for late gestation and transition dairy goats to help minimize metabolic disease and facilitate the transition to milking.

The **SHUR-GAIN Capri Transition Dairy Goat Ration** is formulated to be fed free choice for at least 3 to 6 weeks prior to kidding. Adapt the does gradually to the ration. Feed this ration, along with hay, free choice. Ensure the does have good quality hay available and easy access to clean, fresh water at all times.

Benefits

- Contains a variety of protein and energy sources to meet the requirements of the close-up dry does as well as support fetal development.
- Contains highly digestible fibre sources that allow it to be fed free choice, help meet fibre needs and promote feed intake during late gestation.
- Contains the optimum levels of macro minerals, trace minerals and vitamins to promote health and minimize metabolic disease in dry does.
- Contains yeast, which has been shown to optimize rumen function and improve fibre digestion.
- Contains high level of Vitamin E to help prevent retained placenta and weak kids at birth.
